

Technological Firsts

We are proud to announce technical breakthroughs first seen in our products:

Playback Designs Super High Resolution USB

All series of Playback Designs products have the ability to playback, what we like to call, "Super High Resolution" music files. These are files that go far beyond the resolution that most companies are attempting to playback. Currently most companies can only achieve 24/192kHz. Our players and DACs can playback music files up to 24/384kHz PCM and up to 6.1MHz DSD through a USB connection to either a PC or MAC. This is up to 32 times the resolution of players with the ability to playback 192kHz high resolution files.
